PROJECT SUMMARY:
To produce a landscape schematic site design of the Botanical Community Garden located within the City of Temecula Wine Country. The design intent will address many things such as: creating a sense of community, sustainable aspects such as native planting, water, waste management, urban ecosystems, recycling programs, human living and well being. Site analysis and further research will complete the understanding of the existing and proposed development and its context is required. This site analysis was a group effort of the existing conditions of the site.

PURPOSE OF ANALYSIS:
This Inventory and analysis includes weather conditions, circulation patterns, views, site notes and purposed site conditions. Site analysis also shows the site boundary and what surrounds the site area.

SYNTHESIS:
Site analysis is directly informs our design process because it gives us a better understanding of the site and provides information about critical issues as well as design opportunities for the site. This is critical part of the beginning stages of our design process.
